Reproof Tab

The label that tells owners when to reproof.

Coating working
Water beads. Tab stays blank.

Coating worn off
Fabric soaks. The word shows.

1 Jan 2028
California's PFAS exemption for wet-weather gear ends

1–2 seasons
typical life of a PFAS-free coating before re-treatment

The problem

- PFAS bans are moving every brand to water-repellent coatings that wear out sooner.
- When the coating fails the fabric soaks, and the owner thinks the product leaks.
- The only check today is to pour water on it and watch.

How it works

- A small tab made of the same coated fabric, sewn where wear is heaviest.
- While the coating works, water beads off and the tab stays blank.
- Once the coating has worn off, the tab soaks and the word REPROOF shows through.
- It hides again when dry and stays hidden after re-treatment.

Why license it

- Care brands: every signal sells a bottle.
- Garment brands: fewer "it leaks" returns.
- No electronics. A few cents of fabric and print.
- A stick-on version can ship in the box with the reproofer.
