Re: Business Analyst, Internal Systems

Dear Hiring Manager,

I am applying for the Business Analyst role in your client's Internal Systems team. The ad asks for someone who delivers end to end rather than gathering requirements and handing off. That is the reason I started building in 2016: the handover between the analyst and the builder is where the meaning goes missing.

A recent example. A national charity's move onto HubSpot had stalled and their donation history was wrong. I found the cause (donors merged on email address instead of the old system's account number, putting totals out by $3.8 million), redesigned the migration, rebuilt 37,729 donations, ran two rounds of testing with their team, and automated the feed from their donation platforms into HubSpot and Xero so it stays right without retyping. Analysis, build, UAT and review, by one person.

I look for automation in the rules people already follow, including the exceptions nobody wrote down. I model the process in BPMN 2.0 first, As-Is and To-Be, so the gaps and bottlenecks are visible before anyone automates them. Doorknock, one of my public tools, keeps its scoring rules as data so the business can change them without a developer.

I will push back when a requirement does not hold up. Reviewing a live platform, I proved security gaps by reproducing them, and I also told the client that one issue reported by an automated tool was not real. Saying no to a phantom saves a team as much time as finding a real problem.

I am based in Adelaide and comfortable working remotely in a small, high-ownership team. I would welcome a conversation about the role.

Kind regards,

Aaron Steele
