SUN-PROTECTIVE SWIMWEAR · AVAILABLE TO LICENSE

Fit Mark

Stripy sun? Size up.

Right size
Sun looks solid.

Outgrown
Stretched fabric. Sun turns stripy.

UPF 50+

is measured on relaxed fabric (AS 4399:2020)

“Relaxed fit”

is CHOICE’s advice, because stretch reduces UPF

The problem

- A UPF 50+ swim shirt is rated relaxed. Stretched fabric lets more UV through.
- Brands already warn about this on their care labels.
- Nothing on the garment tells a parent that last summer’s shirt is now too small.

How it works

- A sun icon is printed across the shoulders as fine bars set close together.
- At the right fit the bars sit closed and the sun looks solid.
- When the fabric is overstretched, pale fabric shows between the bars and the sun turns striped.
- The bar spacing is set to the stretch at which protection drops.

Why license it

- Prompts the next-size purchase at the right moment.
- Turns a small-print warning into a visible safety feature.
- One extra print in a process the garment already goes through.
