PICKLEBALL AND PADEL PADDLES · AVAILABLE TO LICENSE

Grit Dots

When the dots fade, the spin is gone.

24.3 million
Americans played pickleball in 2025 (SFIA)

+479%
growth in US players over five years (SFIA)

The problem

- Paddles get their spin from a rough face, and that roughness wears smooth.
- Worn texture can’t be restored.
- Players have no way to check except rubbing a finger on the face or borrowing a new paddle.

How it works

- Dots are printed only on the peaks of the face texture, around the hitting zone.
- Matching reference dots sit near the handle, where the ball never lands.
- As the peaks wear down, the hitting-zone dots fade.
- Faded against the reference means the grit has gone.

Why license it

- A clear, honest signal to buy the next paddle.
- A visible feature no other brand has.
- One extra print pass. No change to face or core.
- Also suits replaceable face sheets.
