About 4°

the tilt the viral rack hack achieves (House Digest test)

About 9°

the tilt a 12 mm wedge gives an 8 cm mug

The problem

- Mugs sit upside down in the dishwasher and their dished bases hold a puddle of dirty water.
- It spills over clean dishes at unloading.
- The viral fix, tilting the whole rack, gives about four degrees and can block the door.

How it works

- A silicone-covered rail presses onto a row of tines in the top rack.
- Raised wedges along it lift one side of each mug’s rim.
- Each mug rests at roughly nine degrees, so water runs off the base.
- It stays in the rack between washes.

Why license it

- A complaint almost every dishwasher owner has.
- A simple silicone and plastic moulding.
- The before-and-after needs no explanation.
- Sells in pairs.
